./configure --prefix=\$HOME; pkg=\$HOME/python/python-3.5.4; pkg_path=/usr/lib; pkg/python/python-3.5.5 etc. I tried several other options (like adding --with-pkg-configdir=/usr/lib, --with-pkg-path=/usr/lib) but none of them worked for me. I tried copying the entire contents of the directory to /usr/lib (as above) but that didn't work. What can I do to get this job?
